IN THE SPECIFICATION:

Please amend the Specification as follows.

Please insert the following paragraph between lines 23 and 24 of page 5:

Embodiments may be implemented in a computer program embodied on a computer readable medium. For instance, a computer program embodied on a computer readable medium is contemplated for searching for and presenting collections of conventional objects in a computer system. The computer program may comprise a code segment that depicts a meta-folder within a display as a closed representation, wherein the meta-folder contains at least one previously defined search object, and a code segment that selects and opens the meta-folder. The computer program may further comprise a code segment that resolves the search objects in the meta folder into current instances of the conventional objects which are findable in a computerized system, and a code segment that depicts an open representation of the meta-folder within the display which includes the current instances of the conventional objects which are thus found. The meta-folder may be provided as a file, and the computer program may further comprise a code segment that transfers the file from a storage medium into the computerized system. The computerized system may include a network, a client device which is connectable to the network, and a server which is connected to the network. The meta-folder may be stored on the server, and the computer program may further comprise a code segment that connects the client device to the server via said network, and a code segment that accesses the meta-folder on the server via the network.
